**NATIONAL PEDIGREE BOOK  
OF BENGAL TIGER**

## CONTENTS

1. Preface	(v)
2. Introduction	(vii)
3. Abbreviations used in Historical Listing	(viii)
4. Demographic Analysis	1
5. Life Table for Bengal Tiger in Indian Zoos	2
6. Mortality of Bengal Tiger in Indian Zoos	4
7. Comparison of Survivorship and Mortality of Bengal Tiger in Indian Zoos	5
8. Relationship between Fecundity and Net Reproductive Rate	6
9. Founder Analysis of Bengal Tiger in Indian Zoos	7
10. Inbreeding Depression	16
11. Relative Inbreeding Coefficients of Bengal Tiger in Indian Zoos	18
12. Historical Listing of Bengal Tigers in Indian Zoos	32
13. Zoo wise Population of Bengal Tigers	72
14. Historical Listing of Tigers of Unknown Lineage	75
15. Appendix I — Planned Breeding of Bengal Tiger in Indian Zoos	86
16. Appendix II — Molecular Characterization of Wild Animals by DNA Fingerprinting for their better Management in Indian Zoological Gardens	89
17. References	91

## PREFACE

Bengal Tigers are one of the critically endangered large cats of India. It inhabits a wide range of habitats, from the mangrove forests in the East to the dry-deciduous forests in the West. The species is found practically throughout India, except the deserts of Rajasthan, Gujarat and Punjab, and higher reaches of Himalayas. Outside India the species is found in Nepal, Bhutan, Bangladesh and Burma (Anon. 1994). The adaptability of the species to a wide range of habitat conditions and its solitary nature probably account for its survival in the wild. As per the 1997 census the total population of tigers in the wild stood at 3435 (Anon. 2000). However the numbers are no reason for complacency as the animal is severely threatened by both extensive habitat degradation and poaching. Coupled with this, trade in tiger parts across the globe has threatened the survival of this species further. In order that the long term in-situ survival of the species is ensured, conservation through a chain of protected areas has been undertaken. Zoos have been contributing their bit towards conservation of this species. Zoos are also involved in a planned breeding programme of this species for its ex-situ conservation.

The compilation of this pedigree book is a part of this conservation effort. This book collates information from various zoos as on March 1999 and is second in the series published by the Central Zoo Authority. The basic data collection was done by Mr. K.N. Banerji (National Studbook Keeper) with the assistance of Mr. V. Srinivas Rao (Jr. Assistant, Nehru Zoological Park), Mr. S. Devender (Computer Operator, Nehru Zoological Park), and Mr. V. Anand (Computer Operator, C.F. W.L.M., Hyderabad). The data provided was further analysed by Dr. Anupam Srivastav (Consultant) and Mr. Bipul Chakraborty (Scientist, Central Zoo Authority). It is hoped that this pedigree book will be made use of by the managers of various zoos participating in the planned breeding program of the species.

In the process of analysis of this data, certain discrepancies were noted in the Historical Listing. This had led to the exclusion of those animals while preparing the life table. It was also felt that certain zoos have not been upgrading their data with the Studbook keeper, this probably has resulted in his using the data from the earlier edition of the studbook. It is hoped that all these discrepancies would be sorted out in the next edition of the studbook, which will be brought out in association with Wildlife Institute of India, Dehradun.

## INTRODUCTION

Bengal tigers are one of the two large cats of India. The tiger in its habitat is a truly royal animal, a master of all it surveys. A tiger occupies a unique position in the Indian folklore, both as a myth and as an object of awe for its silent, solitary predatory habit. They prefer to rest during the heat of the day under the shade of trees and at dusk go forth in search of prey. During winters they may spend some time in the sun, while in the peak of summers wallow in shallow pools of water. The usual prey base is antelopes, deers and wild pigs. However when prey availability is reduced any animal is hunted and eaten.

The animal lead a solitary existence throughout the year except when they come together to mate. The female brings up its cubs alone without any help from the male. In the wild a tiger reaches maturity at around four years of age while the female has her first oestrous when she is in her fourth year. Cubs are born after a gestation period of 95 to 103 days. There may be two to five cubs in a litter. The litter remains with the mother till around three years of age, during which she teaches them how to fend for themselves. The mother then chases them out from her territory and she is ready to mate again (Crandall, 1964).

The pedigree book provides information on all the specimen registered (both living and dead), their sexes, dates of birth, parentage, locations and where appropriate dates and places of death. The data provided in this pedigree book can assist the zoo managers in locating a new specimen for inclusion in its collection, prevent inbreeding and in facilitating the design of a breeding program for their zoo which will help in conserving genetic diversity of the species. If lineage of all the individuals to be used in the breeding program are known, mating can be planned to ensure that all the bloodlines are equally represented in the captive population, thus reducing loss of genetic diversity over the generations.

Besides the information mentioned above, the present pedigree book provides information on demography, founder representation and inbreeding depression in the captive Bengal tiger population. The demographic information is presented as life table analyses, while the founder representative sums up all the wild caught founders and a list of all their offspring. Inbreeding depression is summarized in the form of inbreeding coefficients, a measure of inbreeding depression.

INS Indian Stud Number

## DEMOGRAPHIC ANALYSIS

For managing a planned breeding programme information on natality, mortality, survivorship, fecundity and age of first breeding is important. This information enables the zoo managers to plan the breeding of the animals in their care as also to understand the stage in the life cycle of the species at which the mortality rate is at its peak, which is responsible for the maximum deaths. A **life table** systematically represents the demographic information present in historical listing. A life table consists of a series of columns, each of which describes an aspect of mortality statistics for members of a population according to age. The columns include :

- \*  $l_x$  is the number of individuals surviving after regular time intervals.
- \*  $d_x$  is the number dying during successive time intervals.
- \*  $q_x$  is the mortality rate during successive time intervals.
- \*  $e_x$  is the life expectancy at the end of each time period.
- \*  $m_x$  is the age specific fecundity.

Data of 371 tigers for which complete information was available were used to prepare the life table of Bengal tiger. Analysis of the life table suggests that they are most vulnerable in their first year of life. As many as 45% of the animals died in the first year itself. The animals start breeding when they are three years of age and continue breeding till fifteen years of age. The most productive years are the eighth and ninth respectively, when maximum fecundity was observed. The maximum life span in captivity was 23 years for a female. Animals, which survive the first year of their life, have a good probability of reaching nineteen years of age when the second peak in mortality is observed.

## COEFFICIENT OF INBREEDING

Inbreeding defined simply is breeding between relatives. With inbreeding mates on the average are more closely related than they would be if they had been chosen at random from the population. The reasons for inbreeding are small isolated populations, close proximity of potential mates, ecological preferences and morphological resemblance among individuals. With inbreeding the frequency of alleles does not change but homozygosity increases at the expense of heterozygosity. Inbreeding depression is quantified as Coefficient of inbreeding or Relative Inbreeding Coefficient.

### Coefficient of inbreeding

The coefficient of inbreeding indicates the percentage of loci that were heterozygous in the base populations that now have probably become homozygous due to the effects of inbreeding. The base population is that point in history of the population from which we desire to begin a calculation of the effects of inbreeding. Many loci are probably homozygous at the time of establishment of the base population. The inbreeding coefficient then measures the additional increase in homozygosity due to mating of closely related animals.

The coefficient of inbreeding (F) can be determined for an animal in a pedigree by several similar methods.

1. If the common ancestor is not inbred :

$$F_x = \Sigma (.5)^{P_1 + P_2 + 1}$$

Where  $p_1$  is the number of generations from one parent back to the common ancestor and  $p_2$  is the number of generations from the other parent back to the same ancestor.

2. If the common ancestors are inbred ( $F_A$ ), the inbreeding coefficient of the individual must be corrected for this factor.

$$F_x = \Sigma [(.5)^{P_1 + P_2 + 1} (1 + F_A)]$$

The following table will be helpful in calculating F.

n	$(.5)^{P_1 + P_2 + 1}$	n	$(.5)^{P_1 + P_2 + 1}$
1	5	6	.156
2	25	7	.0078
3	125	8	.0039
4	0625	9	.0019
5	0312	10	.0009

In the following pages, an attempt has been made to calculate the inbreeding coefficient of Bengal tigers listed in the studbook.

## RELATIVE INBREEDING COEFFICIENTS OF BENGAL TIGER IN INDIAN ZOOS

## APPENDIX I

### PLANNED BREEDING OF BENGAL TIGERS (ANON. 1995)

A meeting on the various aspects of the planned breeding of Bengal Tigers was held on 28.2.95 at Bhubaneswar. The following recommendations were made taking into consideration the various aspects of tiger management in relation to planned breeding of Bengal Tigers.

1. The following zoos were identified as participating zoos of the country for planned breeding of Bengal tiger. Each zoo may make available one enclosure for this purpose.
  - (a) Sri Chamarajendra Zoological Garden, Mysore
  - (b) Arignar Anna Zoological Park, Chennai
  - (c) Nehru Zoological Park, Hyderabad
  - (d) Nandankanan Zoological Park, Bhubaneswar
  - (e) Sanjay Gandhi Zoological Park, Patna
  - (f) Alipore Zoological Garden, Calcutta
  - (g) Assam State Zoo, Guwahati
  - (h) M.C. Zoological Park, Chatbir
  - (i) National Zoological Park, Delhi
2. Only the 29 identified wild origin Bengal tigers available in the zoos of the country will participate in the planned breeding programme to begin with, other wild origin tigers shall be taken into the programme whenever they come.
3. The tigers to be selected for pairing out of 29 wild origin Bengal tigers already identified will be decided by the species coordinator in consultation with Dr. A.K. Roychoudhury.

4. The age, size, health and reproductive capacity of all animals are to be taken into consideration before deciding on the pairing of the animals.
5. Before sending the tigers from one zoo to the other for inclusion in planned breeding programmes, all the identified wild origin Bengal tigers should be tattooed or marked with transponders for individual identification and follow up action.
6. A half-yearly performance report of the participating tigers has to be sent to the species coordinator by the participating zoos. The proforma for the half yearly report will be circulated by the species coordinator.
7. Gene Resource Bank under this programme can be entrusted to C.C.M.B. Hyderabad.
8. (a) Efforts should be made to maintain the present level of tiger population outside the planned breeding at least for five years.
9. A middle level manager or the zoo veterinarian of each participating zoo can be trained on all aspects of tiger management who in turn should train keepers in respective zoos.
10. A husbandry manual for Bengal tiger is to be prepared by the species coordinator. For this information should be made available to the species coordinator by different zoos. Central Zoo Authority may provide financial assistance for this.
11. Expert opinion may be obtained if the spacing between births need be adopted for planned breeding programme.
12. All participating animals should be vaccinated with all available Feline vaccines.
13. In case any disease, epidemic or health problem is noticed in any zoo, such information should be circulated to all other participating zoos for taking preventive measures in the respective zoos.
14. As it is not possible to meet the expense on transportation and handling of these animals, enclosure improvement, vaccines, feline milk powder and other aspects of this programme by the participating zoos, it is recommended that Central Zoo Authority should provide financial support for these items under this programme.

A second meeting on the planned captive breeding of Bengal tigers was held on 24.4.96 at Indian Institute of Wildlife Management, Bhopal. The following recommendations were adopted in the meeting (Anon., 1996)

1. No price tag is to be attached with the animals, which are to be transferred from different zoos.

2. Double marking system - transponder and a tattoo mark on the thigh, is to be followed.
3. The planned captive-breeding programme would be behind the curtain. No such animals are to be displayed in zoos.
4. It will be responsibility of the receiving zoo to arrange for the transport of animals.
5. It will be the responsibility of the receiving zoo to arrange for the transport of animals.
6. Only one male and one female is to be kept in one enclosure.
7. Each individual animal is to be given ISD and ISIS number.

## APPENDIX II

# MOLECULAR CHARACTERIZATION OF WILD ANIMALS BY DNA FINGERPRINTING FOR THEIR BETTER MANAGEMENT IN INDIAN ZOOLOGICAL GARDENS (SINGH, L., 1998)

Summarized below are the findings of the project on 'Molecular Characterization of Wild Animals by DNA Fingerprinting for their better Management in Indian Zoological Gardens' conducted by Dr. Lalji Singh of Center for Cellular and Molecular Biology, Hyderabad.

The main objectives of the present study with reference to Bengal tigers were :

1. Molecular characterization of tigers in Indian zoos.
2. Identification and characterization of hybrid tigers.

### Findings

**Karyotype :** The karyotype showed chromosomal conservation with  $2n = 38$ . Markedly reduced levels of heterochromatin and poor G and C banding was observed.

**DNA Fingerprinting :** Multilocus fingerprinting with Bkm 2(8) probe was performed using several restriction enzymes (Hin fl, Taq I, BstN I, Hae III, and Mbo I). Bkm 2(8) probe in combination with Hin fl restriction enzyme revealed polymorphism in Indian tigers. 25-27 bands were scored per individual in the 1 kb-8 kb molecular weight range. Majority of the polymorphic bands formed were in the 2 kb-6 kb region. An average heterozygosity of 28% was observed.

**Microsatellite analysis :** Microsatellite analysis was carried out on five CA repeat loci, which are polymorphic in the fields. Microsatellite analysis of 30 Indian tigers revealed an average heterozygosity of 22.65% at three of the five loci. Two of the loci were monomorphic. The levels of variability revealed are much higher than reported and are comparable to any other large outbred population of wild animal. The Siberian tigers showed an average heterozygosity of 29.9% in the loci tested. The Siberian tigers could be differentiated from their Indian counterparts by the microsatellite pattern at locus Fca 126.

Microsatellite analysis of fifteen skin samples of tigers, ranging in age from 50 to 125 years was performed. The average heterozygosity observed was 21.012% and the difference between the present and past populations was not statistically significant. Only those loci, which are polymorphic in the present population showed polymorphism in individuals 50-125 years ago. The loci found to be monomorphic in the present population are found to be monomorphic in the ancient population as well.

**Mitochondrial D loop sequence analysis :** An average nucleotide diversity of 8% was observed among the Indian and Siberian tiger sequences, which translates to a divergence time of 80,000 to 100,000 years. Sequence of the Cytochrome b region showed a single transition from 'G' to 'A' in all the Siberian tigers at position 342.

**Analysis of Hair Samples :** Hair samples of two suspected Indian and Siberian tiger hybrid were tested to confirm hybridization. The analysis of locus Fca 126 revealed that both animals had alleles contributed by each of the species. Mitochondrial Cytochrome b sequence from the hair samples showed 'G' in that particular position indicating an Indian tiger haplotype. Since Mitochondria are strictly maternally inherited, the results indicate that these animals had an Indian tiger mother. The Microsatellite data coupled with the present study suggests that the tigers of Dudhwa could be hybrids of Indian and Siberian tigers.

**Immune Diversity :** MHC class I locus, which plays an important role in the immune system was sequenced to determine the genetic variability. Abundant polymorphisms was observed in the Indian tigers. This data suggests that these species possess significant amounts of immune diversity comparable to any other wild animal, contrary to earlier reports.

**DNA extraction from scats :** A rapid and simple procedure has been developed for the extraction of DNA from scats. The procedure takes one hour to perform with the minimal laboratory requirements. This non-invasive procedure avoids trauma to the animal due to tranquilization and avoids complications during anesthesia. The DNA extracted can be used for routine genetic monitoring of wild animals would become feasible.
