FOREWORD

Wetland habitats are threatened by a variety of anthropogenic activities. One such critically threatened habitat is the Keibul Lamjao National Park in Manipur. The habitat supports a unique vegetation association '*phumdis*' that are the only home for an equally critically endangered Sangai. An additional cause of concern is the limited genetic diversity retained by the population due to its small size. Despite intensive conservation efforts the population continues to remain prone to extinction due to any chance events.

Therefore, maintenance of viable *ex-situ* populations for ensuring their long-term persistence remains imperative. Effective *ex-situ* conservation of the species can be ensured by scientific management to ensure its long-term survival. This would require management interventions that ensure the maintenance of a genetically viable and demographically stable *ex-situ* population. Pedigree information contained in studbooks forms the basis for this management.

The Central Zoo Authority (CZA) in collaboration with zoos in India has initiated a conservation-breeding program for threatened species in Indian zoos. Sangai is a part of the identified species under this initiative. As a part of this endeavour a Memorandum of Understanding has been signed with the Wildlife Institute of India for compilation and update of studbooks of identified species in Indian zoos. As part of the project outcomes, the WII has compiled the National Studbook of Sangai (*Rucervus eldii eldii*) in Indian Zoos. The recommendations contained in the studbook would form the basis for the long-term management of the species in captivity. It is hoped that all holding institutions will adopt the recommendations included in the studbook.

SANGAI

(*Rucervus eldii eldii*)

Species Information

Taxonomy

Kingdom	Animalia
Phylum	Chordata
Class	Mammalia
Order	Cetartiodactyla
Family	Cervidae
Genus	<i>Rucervus</i>
Species	<i>eldii</i>
Sub-species	<i>eldii</i>
Local Name	Sangai

The species was first described in 1839 from Manipur in India as *Cervus frontalis*, and a detailed description of the species was provided by Captain Percy Eld leading to the name *Cervus eldii* (McClelland 1841). The species was split into three sub-species based on descriptions from three separate populations. The population from Manipur was named as *Cervus eldii eldii*; *Cervus eldii thamin* for the Burmese population and *Cervus eldii siamensis* from Thailand (Gee 1961, Aung et al. 2001, Balakrishnan et al. 2003). A fourth population, found in Hainan Island off southern China, was named as *Cervus eldii hainanus* (Xu et al. 1983). The taxonomy of the species has undergone several revisions and the currently accepted classification of the species places it in the genus *Rucervus* with the species and sub-species names remaining unaltered (Grubb 2005). The name was adopted by the IUCN Species Survival Commission (Timmins & Duckworth 2008) and the same is used here.

Recent studies by Angom et al. 2015 and 2017 indicate a closer relationship of the species with sambar (*Rusa unicolor*) and hog deer (*Axis porcinus*). They further reported that phylogenetically the sub-species are monophyletic with *R. e. eldii* being closest to *R. e. thamin*. Their studies also showed the presence of limited genetic diversity in both the wild and captive populations of *R. e. eldii* indicating inbreeding depression in the population. The taxonomic position of the species and its relationship with other deer species remains debatable and is yet to be conclusively established.

Animal Biology

The division of hooves and elongated pasterns (Gee 1961) are adaptations for their unique *phumdi* habitat. The species is a medium sized deer with a head to body length of adult stags may range upto 170 cm, with a shoulder height of upto 130 cm and body weight upto 150 kg. Females are smaller and weigh less than the males. Both sexes have a short tail. Deciduous antlers present in males emerge from the brow leading to its common name – brow antlered deer. The body of the animals is covered with coarse hair with colour varying seasonally. During winters – the breeding season coat colour in males is dark brown while in summers it is reddish brown (Geist 1998).

Table1: Life history traits of Sangai*

Age of Sexual Maturity	4 years for female
Gestation period	245-273 days
Litter Size	1
Age at weaning	70-90 days
Breeding season	Peaks in March
Life span	20 years
Inter-birth Interval	1 year
Weight at birth	4.7 – 6 kg
Mating System	Polygynous

* Various sources

Habitat Ecology

The subspecies is restricted to a small area of the Keibul Lamjao National Park in Manipur inhabiting wetland areas characterized by floating mats of soil and vegetation (*Phumdis*), patches with floating rooted vegetation, open water areas, small hillocks and shallow water areas (Sanjit et al. 2005). The animals spend considerable part of their time on the *phumdis*; however, drier areas that include tall reeds and grasses and hillocks are preferred for resting (Singh 1991 in Hussain *et al.*, 2004, Angom 2012). The animals rest under tall reeds and grasses during most part of the day.

Vegetation forming the *phumdis* was reported to include 185 plant species of 50 families and 121 genera. The dominant species included *Zizania latifolia*, *Hedychium coronarium*, *Impatiens sp.*, *Cyperus difformis*, *Cyperus rotundus* and *Polygonum spp.* (Tuboi et al. 2015). Highest productivity reported was that of *Zizania latifolia* and formed approximately a third of the diet of Sangai while graminoids formed 80% of the diet of the species (Tuboi and Hussain 2014). Singh, (1991) reported 233 plant species belonging to more than 58 families forming part of the diet of brow-antlered deer. They exhibit a bi-modal activity pattern with foraging peaks at early morning around 0430 hrs-0800 hrs and 1500 hrs – 1800 hrs in the evenings (Hussain et al. 2004).

Social Organization and Behaviour

Details on the social organization and behavior patterns of the sub-species are not available; however information on a closely related sub-species *Rucervus eldii thamin* as described by Aung et al. (2001) suggest that the adults are solitary with males and females coming together during the breeding season, while the female – fawn association is strong and observed throughout the year. Patterns of aggression and reproductive behavior as described in literature are similar to that described for other deer species, with a high frequency of aggressive encounters between males occurring during the rutting season for establishing social hierarchy. Male display behavior includes scent marking by rubbing the pre-orbital organ on the bushes and thrashing vegetation with their antlers and forelegs (Hussain et al. 2004).

Reproduction

They are seasonal breeders with a peak reproductive activity during March. Dominant stags identify and associate with estrous females. Mating takes place when the does are at the peak of their estrous cycles (Hussain et al. 2004). A single fawn is usually born after a gestation of 213 days with new-born fawns concealed in vegetation (Hussain et al. 2004). Does provide parental care till the fawns start walking independently (Singh 1993) with fawns feeding on grass by fourth week and are weaned by the end of the fourth month (Hussain et al. 2004).

Distribution

The subspecies *Rucervus eldii eldii* has an extremely limited distribution range and is restricted to a single location, the Keibul Lamjao National Park, of Manipur (Figure 1: Circled in red). The total area of the park is 40 km²; however, the actual area utilized by the animals is only about 15 km² (Hussain et al. 2004).

Threats and Conservation Status

Sangai are threatened by the degradation of their unique 'Phumdi' habitat at the single location – Loktak Lake due to the construction of dam that limits the seasonal changes in water level crucial for the uptake of nutrients from the bottom by the *phumdi*. An additional cause for concern is the limited genetic diversity present as a consequence of the small population size. This has led to both the captive and wild populations retaining limited genetic diversity (Angom et al. 2017). They are accordingly listed in Schedule I of the Wildlife Protection act; the IUCN Redlist of threatened species has listed it as Endangered based on a species wise assessment (Gray et al. 2015).

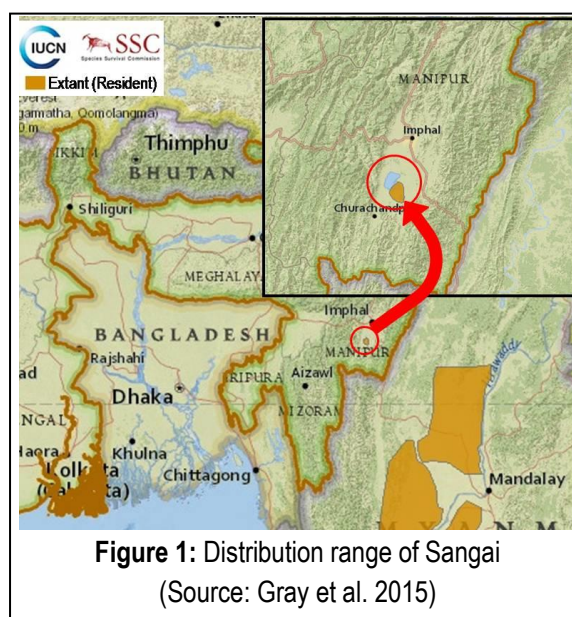

Figure 1: Distribution range of Sangai
(Source: Gray et al. 2015)

Status in Captivity

The sub-species is held at 6 institutions in India with a total of 54 (15.18.21) specimens, while it is not represented in any institution outside India according to the ZIMS database (downloaded on 25 April 2018). The CZA inventory (Table 2) indicates the presence of 223 (99.95.29) specimens, at 15 Indian zoos while the data that was made available by holding zoos for the update of the studbook includes information of 172 (76.83.13) specimens; however, information for 10 (5.3.2) specimens provided by Kanan Pandari Zoo, Bilaspur (Table 2(a)) was in the form of an inventory and could not be included in the SPARKS database.

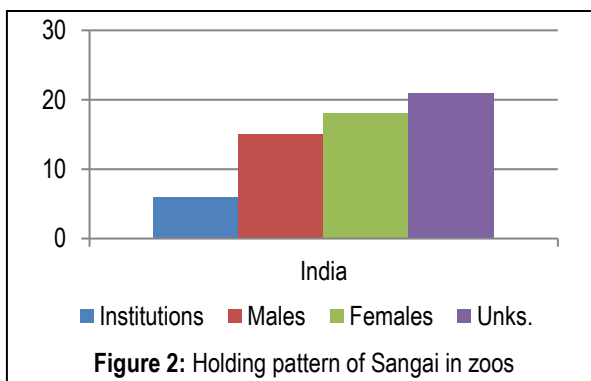

Figure 2: Holding pattern of Sangai in zoos

Pedigree records of 162 (71.80.11) specimens housed at 10 locations were used for the compilation of the studbook.

Methods

Data on individual history was collected by means of questionnaires, zoo visits and from the websites of CZA and Species360. Questionnaires were sent to the institutions housing Sangai in India, requesting information for each captive specimen. Data was entered in the Single Population Analysis and Records Keeping System (SPARKS v 1.66) (ISIS 2004) and subsequently exported to population management programme PMx v 1.2 (Ballou *et al.*, 2011) for further analysis.

Scope of the Studbook

- The CZA inventory was used as a benchmark for population estimates and deviations from the same (Table 1) are attributed to non-availability of pedigree records from the holding institutions though repeated requests for the same were made.
- The studbook includes all specimens present in Indian zoos for which records were available from holding institutions. Efforts were made to retrieve information on their holding from the taxon report of the species from the Species360 website for institutions from which records were not received.
- The mnemonics present in the SPARKS software were used as names for individual institutions; while for those institutions for which mnemonics were not present in the SPARKS Software, the same were assigned based on their location listed on the CZA Website and the same are listed in the location glossary (Annexure IV). The mnemonic India was used for all specimens acquired from the wild.
- The studbook includes specimens with incomplete transaction histories, including location at which they were held/ acquired from. For all such transactions the mnemonic INDIA has been used.

- The mnemonic MANIPUR has been used for specimens that have been acquired from wild.
- Data from Mahendra Chaudhury Zoological Park, Chatbir 3 (1.1.1), obtained from the taxon report of the sub-species was in the form of an inventory with no information on individual specimens and thus not amenable for entry in SPARKS. The same was accordingly not included in the SPARKS database. Individual records of specimens that were available from transactions between institutions were however recorded in the database.
- Information provided by Kanan Pandari Zoo, Bilaspur for 10 (5.3.2) specimens held by them was in the form of an inventory with no information on individual life-history events and parentages; it was accordingly excluded from the SPARKS database.

Analysis

Demographic Status

Historical Population

The studbook includes a total of 603 (255.265.83) specimens that have been housed at 16 Indian zoos. The first recorded entry of the species in captivity was at Alipore Zoological Garden in 1956, with a wild origin female being acquired by the zoo. Growth in the population has been primarily due to captive births [595 (255.265.83)] forming 98.67% of the captive population. A total of 8 (5.3.0) specimens have been acquired from the wild accounting for approximately 1.33% of the total population. The number of specimens reproducing in the population includes 66 (28.38.0) specimens that form approximately 11% of the total population. Figure 3 and Table 3 summarize the trends of the historical population while Annexure I includes detailed event-wise information on individual specimens.

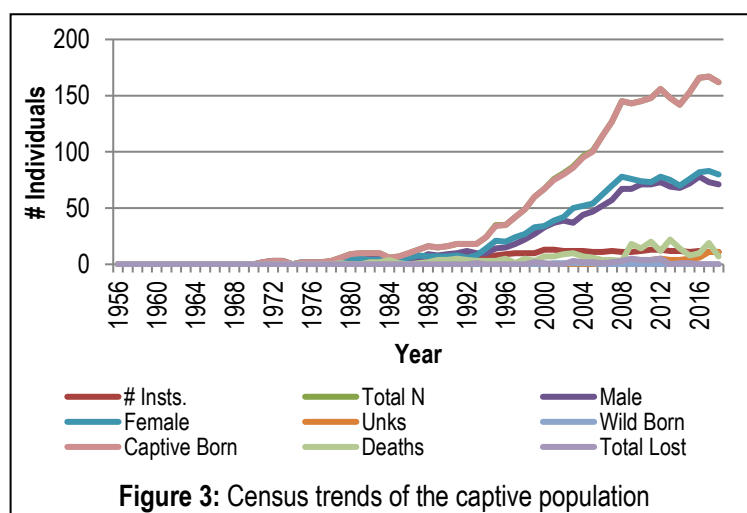

Table 3: Summary of the Historical Population

	Males	Females	Unknown	Total
Studbook size	255	265	83	603
Acquisition from wild	5	3	0	8
Captive-birth	250	262	83	595
Deaths	169	166	69	404
Breeding individuals	28	38	0	66
Lost to follow up/ released	15	19	3	37

Living Population

The living population includes 162 (71.80.11) specimens housed at ten institutions; with no wild origin specimens. Only 5.92% or 9 (2.7.0) animals are proven breeders in the living population. Table 4 summarizes the status of the living population while Annexure II provides location-wise specimen details of the living individuals.

Table 4: Summary of living population

	Males	Females	Unknown	Total
Living	71	80	11	162
Wild-born	0	0	0	0
Captive-born	71	80	11	162
Breeding	2	7	0	9

Population Vital Rates

Table 5 summarizes the vital rates of the population. The population is currently declining at a rate of approximately 15% annually with females showing a faster decline.

Table 5: Vital rates of the captive population

	Males	Females	Total
λ : Population growth rate	0.860	0.838	0.849
T: Generation time	7.9	7.3	7.6
N 20: Population after 20 years	9.9	14.9	24.7

The captive population has a generation time of 7.6 years. The declining population trend is also reflected in the projected population after 20 years with a loss of 137 individuals in the population. The accuracy of the life table analysis carried out to arrive at the conclusions is limited by the small number of known age and sex specimens in the population.

Age Distribution

Age distribution of 151 (71.80) known age living specimens indicates a female bias. The living population includes 113 (45.61.7) specimens in reproductively active age classes (Figure 4); however, of these only 9 (2.7) are reproductively active (Table 4). The population also includes 29 (19.6.4) and 20 (7.13) specimens respectively in the pre-reproductive and post-reproductive age classes. A comparison of table 4 and figure 4 suggests that the likely cause of the declining trend observed in the population is an outcome of the limited number of specimens in the breeding pool despite the presence of a large number of specimens of reproductively active age classes.

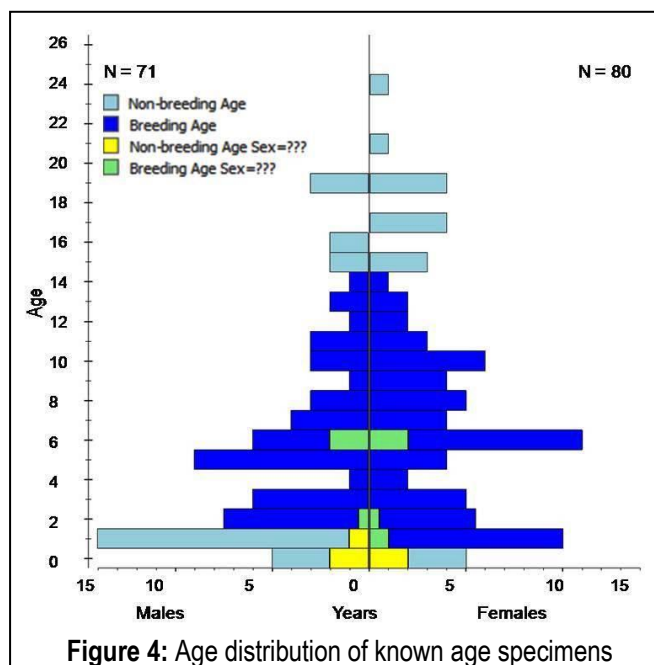

Figure 4: Age distribution of known age specimens

Genetic Status

Based on records made available by holding zoos a total of 7 (5.2) wild origin animals were included in the population since its inception in 1956. Of these 3 (2.1) have reproduced and are ancestors of specimens constituting the current population. The limited number of founder animals used for establishing the program and lack of information of ancestries that

can be traced back to wild origin specimens; however, limits genetic analysis. The small founder base; however, indicates that the population is highly inbred due to the limited mating choices available.

Table 6: Genetic Summary of the current population

Genetic parameters	Current
Founders	0
Living Animals	162
Percent Ancestry Known	0%
Gene Diversity (GD)	0.00
Founder Genome Equivalent (FGE)	0.50
Mean Inbreeding (F)	0.00
Population mean kinship (Mk)	0.50

Pairing Recommendations

Analysis indicates that the current population cannot be traced back to wild origin animals due to the lack of knowledge of ancestries. The population is highly inbred as it originates from only 3 (2.1) founders. A study on the genetic diversity of the captive and wild populations of the sub-species indicates that it retains limited genetic diversity (Angom et al. 2017). The lack of knowledge of ancestries and tendency towards genetic homozygosity constrains the development of pairing recommendations for Sangai in captivity.

Constraints in Population Planning

The records made available for the development and update of the studbook of Sangai provide information for arriving at an understanding of the demographic status of the captive population; however, lack of information of ancestries of specimens limits genetic analysis. This constrains the development of a population management plan for the species. The limited founder base of the captive population and the homozygosity of both the captive and free ranging populations as suggested by Angom et al. 2017 further constrain the availability of new founders that can augment the limited genetic diversity present in the population.

Conclusions and Recommendations

Sangai (*Rucervus eldii eldii*) is a critically endangered sub-species of *Rucervus eldii* existing as a single small population in the Keibul Lamjao National Park in Manipur. The population is extremely susceptible to extinction due to its small size, limited available habitat and the genetic bottleneck it has undergone. Maintaining a demographically stable and genetically viable *ex-situ* populations is thus critical for ensuring the long-term survival of the species.

The captive population is characterized by a large size with 113 (45.61.7) specimens in reproductively active age classes; however, only 9 (2.7) of these are reproductively active. Records made available for

the development of the studbook provide limited information on the ancestries of specimens and constrain an assessment of its genetic status. Additionally, a recent study by Angom et al. (2017), indicates the homozygosity of both the captive and wild populations. Effective management of the captive population therefore requires intensive management efforts aimed at:

Record keeping and marking: The zoos holding the sub-species in captivity must ensure individual animal identification and effective record keeping for developing population management plans.

Assessment of genetic status: Limited information on parentage limits development of population management plans for the sub-species in captivity. The use of appropriate molecular genetics tools to assess the genetic status of the captive population and understand relationships between individuals would assist in development of a population management plan.

Bio-technological interventions: Both the captive and free ranging populations have been reported to have a limited genetic diversity (Angom et al. 2017), thus augmentation of the captive population with additional founder animals would have minimal benefits. Institutions outside India have developed bio-technological interventions that are needed for effective conservation of the species/sub-species. Collaboration/ technology transfer from these institutions can be of great importance in effective management of the sub-species in India.
